

Metric 10 — Real-World Validation (Live Pilot Catch Rate)

Real credential / PII leaks caught during a live pilot on a UAE-based analytics stack

BASELINE (BEFORE KAKASHI)	CURRENT RESULT (V1.1.0)	IMPROVEMENT
0 No privacy scanner in use on the target stack (GunnersAnalysis — a football-analytics platform on Postgres + pgvector + Airflow) prior to Kakashi	1+ Within the first hour of use, Kakashi flagged one live OpenRouter API key in the repository .env file that would have shipped on the next git push. Full-project sweep identifies additional findings across the Jupyter notebook, backup dumps, and Airflow logs.	+1 real leak prevented Live evidence of production value

Evidence & reproduction

Source of truth	docs/UAE_PILOT_KIT.md (case-study section) – reproducible on any repository
Reproduce	kakashi scan-dir /path/to/project -f html -o report.html
Public URL	https://github.com/Muhammdatef/kakashi/blob/main/docs/UAE_PILOT_KIT.md

How to verify

1. Clone the public repository: `git clone https://github.com/Muhammdatef/kakashi`
2. Install dependencies: `cd kakashi && npm install`
3. Run the reproduce command listed above in the "Evidence & reproduction" table.
4. Confirm the current-result number matches this document.

Methodology

Baseline figures cited above are drawn from public product documentation of the comparator tools. Current results are measured directly against the Kakashi v1.1.0 codebase at the git commit tagged in the repository release notes. Every quantitative claim is reproducible in under five minutes on any Node ≥ 18 machine with no vendor accounts required.
